

Kale App - iPhone Setup (Expo Go)

You need

- Mac + iPhone on the same Wi-Fi
- Expo Go from the App Store
- Node.js from nodejs.org (LTS)
- GitHub access to the Kale repo (Kale will invite you)
- A .env.local file from Kale (do not share it)

One-time setup (Mac)

1. Install Node.js from nodejs.org
2. Open Terminal
3. Clone the repo from GitHub:

```
cd ~/Downloads
git clone https://github.com/JannatTariq0808/kale-mobile-app.git
cd kale-mobile-app
```

If asked to sign in to GitHub, use your GitHub account.

4. Install dependencies:

```
npm install
```
5. Put .env.local in the kale-mobile-app folder (from Kale)

Run the app (each time)

1. In Terminal:

```
cd ~/Downloads/kale-mobile-app
npm run start:go
```
2. A QR code appears on your Mac
3. On iPhone: Camera, scan QR, open in Expo Go
(or Expo Go -> Scan QR code)
4. Keep Terminal open while testing

Get latest code (optional)

1. In Terminal:

```
cd ~/Downloads/kale-mobile-app
git pull
npm install
```

If it won't load

1. Same Wi-Fi on Mac and iPhone
2. Restart with cache clear:

```
npm run start:go -- --clear
```
3. Try tunnel mode:

```
npx expo start --tunnel
```

Then scan the new QR code

4. Update Expo Go in the App Store

Important

- Use npm run start:go (not npm start)
- Do not share .env.local
